

## **January Building Project Update**

Construction continues to progress on schedule for the new Malvern K-12 building. The concrete floor slab has been placed in the student dining and stage areas, as well as installation of the structural framing that ties the building areas together. Roofing has been completed over the two-story classroom wing and is currently in progress over the administrative areas. The masonry contractors continue to finalize work on the exterior brick veneer and interior masonry block partitions. The windows for the building are on-site and have completed installation in the classroom wings, with progress continuing around the perimeter of the school. Contractors have installed the HVAC supply ductwork, boiler room sprinkler piping and the permanent power supply electrical switchgear. On the exterior of the building, the connecting access road that runs between Coral Road and Sycamore Road has been paved and completed. In the coming months, the focus will move to finishes on the interior of the building. Temporary heaters have been placed in the enclosed areas to prep the walls for paint in the coming weeks.
